

Indexable ball end mill for finishing

ABPF *type*

Ball Precision F ABPF

MOLDINO Tool Engineering, Ltd.

New Product News | No.0902E-20 | 2023-6

High cutting performance by S-shaped cutting edge!
High helix edge shape provides a beautiful cutting surface.
Insert for high-accuracy machining suppresses chatter even in corners.

Tougher and Stronger

Introducing 6 Modular Mill Type with Air hole items!

Features 01 Set up R accuracy : ±0.01mm

- High accuracy is exhibited from the ball tip to the outer circumference.

Features 02 Excellent cutting performance and beautiful cutting surface finish.

- High helix edge shape suppresses growth of cutting force.

Features 03 New material for longer life.

- Multi-layer coating provides long life.

※For details regarding cutting performance, see p.18.

Technology

An effect by high helix edge shape

Typical conventional problem

Chattering happened frequently while cutting R-shape or similar. The more the cutting force, the more the chattering which makes cutting mark on the work surface.

Reduce cutting force

High helix edge shape suppresses rapid growth of cutting force. This relieves chattering while cutting and improves cutting surface finish.

- Improved cutting surface finish.
- Less chattering on corner.

Merit

Improved machining performance and machining accuracy can be expected, reducing work for downstream processes.

Improved quality

Cost reduction

Time savings

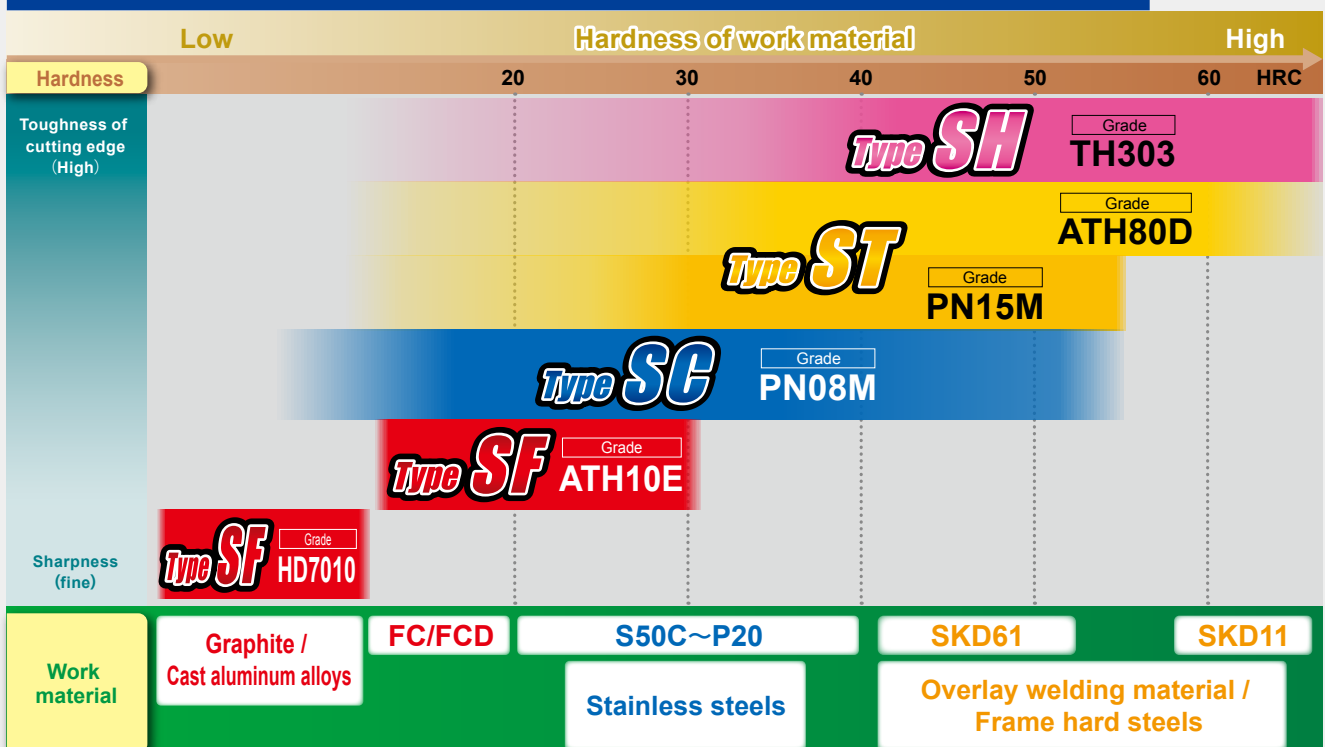

Improved tool life

Less cutting force reduces chipping due to wear and impact, thus tool life is improved.

Recommended grades map

Recommendation of based on hardness of work materials

Features

- TH coating has further evolved to the new 3rd-generation TH coating.
- New film composition and film structure improves heat resistance and wear resistance.
- New multi-layer structure provides excellent durability and suppresses crack progression.

Strong fields

- High-speed finishing of hardened steels (45 to 65 HRC) such as SKD11, SKD61, SKH, SUS420 types, etc.
- High-speed finishing of pre-hardened steels such as P20, P21, etc.
- TH308 uses ultra-fine carbide alloy with excellent wear resistance and TH3 coating to demonstrate good performance especially for finishing of high-hardness materials.

Characteristics

Features

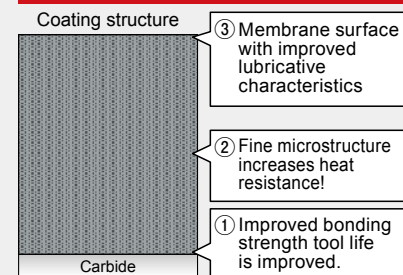

- Industry's first multi-layer structure provides improved adhesion and membrane hardness as well as improving the oxidation-resistance temperature.
- PN coating Improve the friction coefficient, reduces generation of heat on cutting.

Strong fields

- Exhibits stable tool life in cutting materials such as plastic injection molds etc. where tool seizure often occurs. Realizes longer tool life in cutting prehardened steels such as carbon steels, alloy steels, stainless steels, hot and cold tool steel, etc.
- PN08M adopts micro-grain substrate and PN Coating. Improve the cutting performance for plastic injection mold finishing.
- PN15M adopts micro-grain substrate and PN Coating. Improve the cutting performance for overhang cutting.

Characteristics

Cross-sectional structure and characteristics of PN coating membrane

Characteristics

- Uses diamond with good crystallization. Ideal for cutting of graphite, high-silicon aluminum alloys and fiber-reinforced plastics (FRP).
- Our exclusive pre-treatment technology is used to provide higher adhesion due to anchor effect.
- Special material for Diamond Coating is adopted for base metal.

Machining example of Graphite (HD7010)

Cutting conditions
 Cutter Body : ABPF10S10WL140 (φ10)
 $v_c=200\text{m/min}$ $n=6,370\text{min}^{-1}$
 $v_f=2,500\text{mm/min}$ ($f_z=0.2\text{mm/t}$)
 $a_p \times a_e=0.5 \times 0.3\text{mm}$ Dry

※mark : Regrinding of HD7010 tools cannot be performed. Inserts other than HD7010 with diameters of Ø10 or more can be regrinded. Insert Ø16 or above may be re-ground up to twice.

Please inquire insert re-grinding / re-coating to sales office.

Set-up Procedures of Inserts

- 1 Clean the insert seat:
Using air-blow or alike, clean the seat.
- 2 Put in the insert with its top positioned to the screw-tightening side of the tool body.
- 3 Tighten the clamp screw with the special wrench.
Please do not press down the insert during this tightening process.
- 4 This is the end of insert set-up.

To meet the specification for precision of $\pm 0.01\text{mm}$, please follow this procedure.

Attention

Never tighten the clamp screw without putting the insert. The tool body may be deformed, resulting in improper insert mounting or deterioration of mounting accuracy.

Do not tighten the screw without putting insert

Red screw arbor

Dimensions for the Modular Mill mounting

Caution

- Some of the indexable end mills cannot be attached to the RED screw arbor. Please check your indexable end mills for conformance to the dimensions, or please contact MOLDINO Tool Engineering, Ltd.
- Because cutting resistance is greater than the tool holder connection force associated with the machine spindle, please reduce the recommended cutting conditions by 50% for the RED screw arbors marked with ※. Otherwise, the tool holder shank may experience fretting corrosion or fall out of the machine spindle.

- Standard accessories
- Coolant duct(HSK)
- Caution
- The Modular Mill is not a standard accessory.
- Pull stud is not a standard accessory.
- Please check your Modular Mills for conformance to the dimensions.

δ About the rigidity value

A rigidity value represents the amount of deflection for the entire holder and tool when a bending load of 1 kgf (9.8 N) is applied to the tip of the tool. The smaller the numerical value is, the higher the rigidity and the more accurate the machining.

Recommended Cutting Conditions

※ Red indicates primary recommended insert grades.

Work material	Recommended inserts grade		Cutting conditions	φ 6			φ 8			φ 10			φ 12

- [Note]** ① Use the appropriate coolant for the work material and machining shape.
 ② These conditions are for general guidance; in actual machining conditions adjust the parameters according to your actual machine and work-piece conditions.
 ③ Be sure to practice safety instructions and precautions such as wearing glasses and safety shoes, and placing safety covers when you use this tool. Because this tool can be broken during machining so failure to follow these instructions may cause personal injury.
 ④ Never attempt to modify the carbide shank holder. In case of finish cut with overhang=3DC or more, please set cutting depth a_p as below.
 When DC=12mm or less, $a_p=0.2$ mm or less. When DC=16mm or more, $a_p=0.3$ mm or less.

3DC ~ 5DC	70%	70%
5DC ~ 8DC	60%	60%
8DC ~ 10DC	50%	50%

Cutting performance

01 Cutting force comparison between conventional edge shape and high helix one.

Cutting conditions

Work material : S50C (220HB)
 Tool : Diameter $\phi 30$
 $V_c = 200\text{m/min}$ $f_z = 0.1, 0.15, 0.2\text{mm/t}$
 Axial depth of cut (a_p) = 15mm
 Radial depth of cut (a_e) = 0.5mm

Type SH

02 Strength comparison of tip chisel by heavy interrupted cutting test

ZDFG-SH (High helix edge shape)

Conventional

Cutting conditions

Work material : SKD11 (60HRC)
 Tool : ABPFM25 (Diameter $\phi 25$)
 Shank : ASC25-12.5-265-145 (Overhang : 183mm)
 $V_c = 314\text{m/min}$ ($n = 4,000\text{min}^{-1}$)
 $f_z = 0.7\text{mm/t}$ ($V_f = 5,600\text{mm/min}$)
 Axial depth of cut (a_p) = 0.5mm
 Radial depth of cut (a_e) = 1.0mm
 Air

Type ST

ZDFG-ST (High helix edge shape)

Conventional (For high hardness)

Type SC

03 Comparison of performance with solid end mill and type SC

ZDFG-SC (High helix edge shape)

solid end mill

Improves chip discharge performance by high helix edge shape.
 Good cutting surface on semi-finishing process.

Cutting conditions

Work material : S50C (220HB)
 Tool : Diameter $\phi 10$
 $V_c = 200\text{m/min}$ ($n = 6,366\text{min}^{-1}$)
 $f_z = 0.1\text{mm/t}$ ($V_f = 1,273\text{mm/min}$)
 Axial depth of cut (a_p) = 0.5mm
 Radial depth of cut (a_e) = 2.0mm
 Air

Type SF

04 Comparison of cutting surface with type SF and conventional

ZDFG-SF (High helix edge shape)

$R_y = 4.85\mu\text{m}$

Conventional

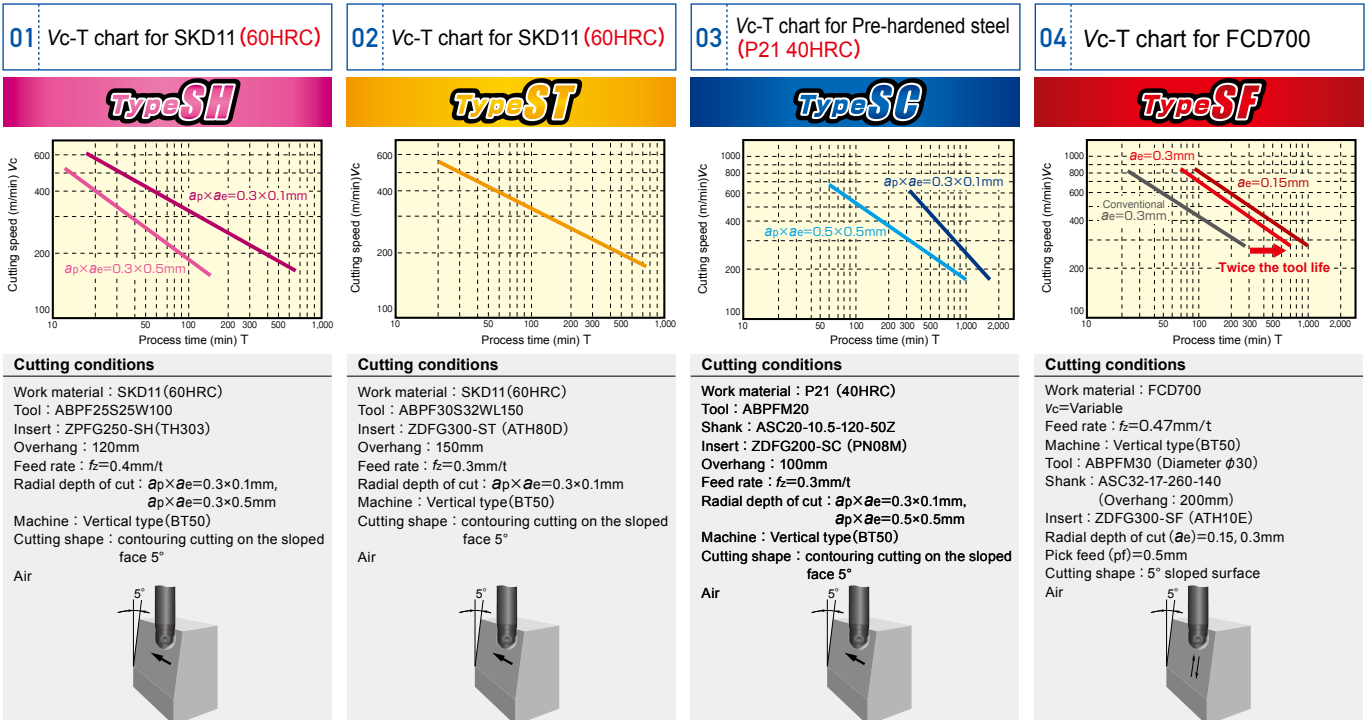

$R_y = 6.51\mu\text{m}$

Cutting conditions

Work material : FCD700
 Tool : ABPFM30 (Diameter $\phi 30$)
 Shank : ASC32-17-260-140 (Overhang : 200mm)
 Machine : Vertical type (BT50)
 $V_c = 800\text{m/min}$ $f_z = 0.47\text{mm/t}$
 Radial depth of cut (a_e) = 0.3mm
 Pick feed (pf) = 0.5mm
 Cutting shape : 5° sloped surface

Field data

Comparative table of the conventional and new items.

Numeric figure comes in a circle ○.

Conventional		Diameter	High helix edge shape inserts

	ACS05E		ZDFG○○○○-SF	ATH10E

Field Data

Cutting examples	Cutting Conditions	Result
<p>Frame hard steels (surface 55~60HRC)</p>	<p>Tool : ABPF25S25W100 Work material : Frame hard steels (surface 55~60HRC) Insert : ZDFG250-ST (ATH80D) Machine : Gate type M/C (BT50) Cutting speed : $V_c = 393\text{m/min}$ Revolution : $n = 5,000\text{min}^{-1}$ Feed rate : $V_f = 5,200\text{mm/min}$ Feed rate : $f_z = 0.52\text{mm/t}$ Depth of cut : $a_p = 0.1\text{mm}$ Pick feed : $a_e = 0.5\text{mm}$ Coolant : Dry</p>	Still normal wear even after 11 hours process. Improves the surface roughness than conventional.
<p>Plastic mold (S50C)</p>	<p>Tool : ABPF20S20WL100 Work material : S50C Insert : ZDFG200-SC (PN08M) Machine : Horizontal type M/C (BT50) Cutting speed : $V_c = 251\text{m/min}$ Revolution : $n = 4,000\text{min}^{-1}$ Feed rate : $V_f = 2,000\text{mm/min}$ Feed rate : $f_z = 0.25\text{mm/t}$ Depth of cut : $a_p = 0.1\text{mm}$ Pick feed : $a_e = 0.4\text{mm}$ Coolant : Dry</p>	Still normal wear even after 15 hours process. Improves the surface roughness than conventional.
<p>Press die (as FCD700)</p>	<p>Tool : ABPF30S32W120 Work material : Material equivalent to FCD700 Insert : ZDFG300-SF (ATH10E) Machine : Gate type M/C (BT50) Cutting speed : $V_c = 510\text{m/min}$ Revolution : $n = 5,400\text{min}^{-1}$ Feed rate : $V_f = 4,500\text{mm/min}$ Feed rate : $f_z = 0.42\text{mm/t}$ Depth of cut : $a_p = 0.2\text{mm}$ Pick feed : $a_e = 0.5\text{mm}$ Coolant : Dry</p>	Finished surface is fine. Re-grinding is possible by normal wear after process.
<p>Forging die</p>	<p>Tool : ABPF12S12W Work material : SKD61 (45HRC) Insert : ZDFG120-ST (PN15M) Machine : Vertical type M/C (BT50) Cutting speed : $V_c = 94\text{m/min}$ Revolution : $n = 2,500\text{min}^{-1}$ Feed rate : $V_f = 800\text{mm/min}$ Feed rate : $f_z = 0.16\text{mm/t}$ Depth of cut : $a_p = 0.3 \sim 0.5\text{mm}$ Pick feed : $a_e = 0.5\text{mm}$ Coolant : Dry</p>	Normal wear after overhang cutting (60mm L/D:5)
<p>Machining of graphite electrodes</p>	<p>Tool : ABPF10S10WL Work material : Graphite Insert : ZDFG100-SF (HD7010) Machine : Vertical type M/C (BT40) Cutting speed : $V_c = 251\text{m/min}$ Revolution : $n = 8,000\text{min}^{-1}$ Feed rate : $V_f = 600\text{mm/min}$ Feed rate : $f_z = 0.038\text{mm/t}$ Depth of cut (Rough) : $a_p = 3\text{mm}$ (Finishing) : $a_p = 0.3\text{mm}$ Pick feed (Rough) : $a_e = 4\text{mm}$ (Finishing) : $a_e = 0.1\text{mm}$ Coolant : Dry</p>	Even for tool projection of 75mm (L/D: 7.5), roughing was stable resulting in good finished surface accuracy.
<p>Ductile cast iron and frame hard steels</p>	<p>Tool : ABPF30S32WL150 Work material : Ductile cast iron and frame hard steels (55HRC) Insert : ZPFG300-SH (TH303) Machine : Gate type M/C (BT50) Cutting speed : $V_c = 471\text{m/min}$ Revolution : $n = 5,000\text{min}^{-1}$ Feed rate : $V_f = 5,000\text{mm/min}$ Feed rate : $f_z = 0.5\text{mm/t}$ Depth of cut : $a_p = 0.2\text{mm}$ Pick feed : $a_e = 2\text{mm}$ Coolant : Air</p>	SH (TH 303) performed well with steady wear even in semi-finishing which conventional tool life was unstable. Finishing accuracy of next process was also stabilized.
<p>SKD11 (60HRC)</p>	<p>Tool : ABPF30S32W120 Work material : SKD11 (60HRC) Insert : ZPFG300-SH (TH303) Machine : Vertical type M/C (BT50) Cutting speed : $V_c = 377\text{m/min}$ Revolution : $n = 4,000\text{min}^{-1}$ Feed rate : $V_f = 3,000\text{mm/min}$ Feed rate : $f_z = 0.38\text{mm/t}$ Depth of cut : $a_p = 0.2\text{mm}$ Pick feed : $a_e = 0.6\text{mm}$ Coolant : Dry</p>	SH (TH303) stabilized tool life and could increase efficiency even in semi-finishing which conventional tool had to reduce cutting conditions. Finishing surface roughness is also good.

The diagrams and table data are examples of test results, and are not guaranteed values.

Attentions on Safety

1. Attentions regarding handling

- (1) When removing the tool from the case (package), be careful not to drop it on your foot or drop it onto the tips of your bare fingers.
- (2) When actually setting the inserts, be careful not to touch the cutting flute directly with your bare hands.

2. Attentions regarding mounting

- (1) When preparing for use, be sure that the inserts are firmly mounted in place and that they are firmly mounted on the arbor, etc.
- (2) If abnormal chattering occurs during use, stop the machine immediately and remove the cause of the chattering.

3. Attentions during use

- (1) Before use, confirm the dimensions and direction of rotation of the tool and milling work material.
- (2) The numerical values in the standard cutting conditions table should be used as criteria when starting new work. The cutting conditions should be adjusted as appropriate when the cutting depth is large, the rigidity of the machine being used is low, or according to the conditions of the work material.
- (3) The inserts are made of a hard material. During use, they may break and fly off. In addition, cutting chips may also fly off. Since there is a danger of injury to workers, fire, or eye damage from such flying pieces, a safety cover should be installed and safety equipment such as safety glasses should be worn to create a safe environment for work.
 - Do not use where there is a risk of fire or explosion.
 - Do not use non-water-soluble cutting oils. Such oils may result in fire.
- (4) Do not use the tool for any purpose other than that for which it is intended, and do not modify it.
